IDENTIFIERS African Americans; \*Maryland

## ABSTRACT

This Kids Count report details statewide trends in the well-being of Maryland's children. The statistical portrait is based on 14 indicators of child well being: (1) child poverty; (2) child support; (3) births to teens; (4) low birthweight infants; (5) infant mortality; (6) lead screening; (7) child abuse and neglect; (8) child death rate; (9) teen violent death; (10) school violence; (11) juvenile violent crime arrests; (12) third grade reading achievement; (13) on-time graduation; and (14) high school completion. Charts compare Maryland counties in the domains of health, economic, safety, and preparing for adulthood. The bulk of the report presents a statewide overview and county data for well-being indicators. Findings indicate that there have been improvements in 10 indicators. Infant mortality has continued to decline. The teen violent death rate has not increased and the child death rate has declined. There have been gains on all three education indicators. However, over 15 percent of children live in poverty, a 33 percent increase in 6 years. There have been increases in low birthweight infants and the juvenile violent crime arrest rate. There are continued disparities between African Americans and whites on low birth weight, infant mortality, teen births, and teen violent death rate. An appendix lists county data on the indicators in aggregate form and describes the methodology and data sources. (KB)

## Our Vision

**M**aryland's children will have opportunities to achieve their full potential. They will reach adulthood having experienced a safe, healthy and nurturing childhood. Children in Maryland will have opportunities to grow physically, intellectually, emotionally and socially. They will be prepared to become responsible, self-sufficient and contributing members of the community.

# Maryland 1996 KIDS COUNT Factbook

## What is KIDS COUNT?

**M**aryland KIDS COUNT is a seven-year project, begun in January, 1993, funded by the Annie E. Casey Foundation. Maryland KIDS COUNT profiles the status of children in Maryland by tracking outcomes of economic well-being, health, safety and education. The five main goals of this project are to:

- develop a clear picture of the condition of children at state and local levels that can be used to guide efforts to improve the quality of life for children;

- track data indicators over time to assess change;

- educate the public and policy makers on the status of children and families in Maryland;

- use KIDS COUNT data as a planning tool to identify priority issues which will assist decision-makers in effectively utilizing scarce public and private resources; and

- maximize collaborative efforts on behalf of children.

Maryland KIDS COUNT Partnership is a collaborative effort of the following: Advocates for Children and Youth, Inc.; Action for the Homeless; Baltimore Urban League, Inc.; Governor's Office for Children, Youth and Families; The Shelter Foundation; The Ready at Five Partnership; Maryland Association of Resources for Families and Youth; Maryland Alliance Against Family Violence; Maryland Business Roundtable for Education; Maryland Committee for Children, Inc.; Maryland State Department of Education; Welfare Advocates; Maryland Education Coalition; Maryland Food Committee and Mental Health Association of Maryland.

Additional copies of the Maryland 1996 KIDS COUNT Factbook are available for a fee of \$15 (postage included).

Please make checks payable to "ACY- KIDS COUNT."

We encourage that any or all portions of this book be copied without prior permission, provided the Maryland 1996 KIDS COUNT Factbook is acknowledged.

## Acknowledgements

The Maryland KIDS COUNT project is funded by a grant from the Annie E. Casey Foundation. Without their dedication and commitment to the well-being of children, this project would not have been possible. Thanks to the national KIDS COUNT project staff- Bill O'Hare and Jennifer Baratz - for their technical assistance and encouragement.

It is with our appreciation that we would like to thank the following individuals for their contribution to the Maryland KIDS COUNT project.

Thanks to the Data Committee for their outstanding effort in helping us collect the various data elements used in this book. They are: Margaret Fowler (Child Support Enforcement Administration, Department of Human Resources), Richard Arnold (Income Maintenance Administration, Department of Human Resources), Ricka Markowitz (Maryland State Department of Education), Arna Griffith (Maryland Committee for Children, Inc.), Deborah Morgan (Maryland Department of Health and Mental Hygiene), John Folkemer (Maryland Department of Health and Mental Hygiene), Dr. Lakshmi Iyengar (Department of Juvenile Services), Estelle Appleburg (Maryland Department of Health and Mental Hygiene), Denise Shearer (Uniform Crime Reporting Program, Maryland State Police), Steve Barry (Maryland Department of Human Resources) and Barbara Conrad (Maryland Department of the Environment). We would like to extend a special thanks to Dr. Isabelle Horon of

the Maryland Department of Health and Mental Hygiene. Her cooperation in providing current and historic data is greatly appreciated.

For their hard work and dedication we acknowledge the KIDS COUNT staff: Jennean Everett-Reynolds, Project Director and Jean Kim, Research Assistant.

We would like to thank Saro Dedeyan of Bulls-Eye Graphics for his innovative and creative design of this factbook.

## Status of Our Children

### Why This Book?

The Maryland 1996 Factbook presents the fourth comprehensive look at the conditions of children and families in Maryland. The factbook measures how well or how poorly children are doing by presenting the best available data to monitor the social, economic, educational and physical well-being of Maryland's children. The data on the fourteen indicators in this factbook are categorized under four domains: Economic Well-Being, Good Health, Safety and Preparing for Adulthood. This factbook provides a detailed state and county level picture of the quality of life of Maryland's children.

This factbook is an important tool in educating the public and decision-makers on the status of children in Maryland. It builds a strong and effective case for improving measurable outcomes for Maryland's children. It is our hope that the increased awareness resulting from the presentation of these data will prompt the interest of all Marylanders to work toward improving the quality of life for our children. This can be done by working together toward public and private solutions to the present and future crises our children face.

KIDS COUNT data will play an integral role in Maryland's systems reform initiative which seeks to improve the way in which needed services are delivered to children and families in

Maryland. One of the major recommendations of this initiative is a move to outcome-based accountability which will require State and local jurisdictions to demonstrate effective service delivery to children and families. This will be achieved by the development of results every jurisdiction must strive to meet which are necessary to ensure the well-being of Maryland's children. Each result will be measured through several indicators, many of which have long been collected, analyzed and published by KIDS COUNT. The results identified are:

- |   |  |
|---|--|
| <input type="checkbox"/> Babies Born Healthy                          | <input type="checkbox"/> Healthy Children                                |
| <input type="checkbox"/> Healthy Adults                               | <input type="checkbox"/> Children Enter School                           |
| <input type="checkbox"/> Children Successful in School                | <input type="checkbox"/> Ready to Learn                                  |
| <input type="checkbox"/> Communities which Support Family Life        | <input type="checkbox"/> Children Completing School                      |
| <input type="checkbox"/> Stable and Economically Independent Families | <input type="checkbox"/> Children Safe in Their Families and Communities |

The Maryland KIDS COUNT Partnership's role in this move to outcome-based accountability will be to continue collection and analysis of critical data elements and work with the reform initiative to develop additional indicators. In addition the Partnership will participate in the identification of reliable data sources to fully evaluate Maryland's attainment of the results critical to the well-being of our children.

## Key Findings About Maryland's Children

### Promising News

The good news is that there have been improvements in ten of the fourteen KIDS COUNT indicators. There is a wide range of improvement from very slight, e.g. less than one percentage point (child support), to increases of close to 25% (third grade reading).

There is promising news to report regarding death rates in Maryland. According to our aggregate year analysis (1985-90 vs. 1991-95) the infant mortality rate has continued its downward trend, declining to 9.3 deaths per 1,000 live births, a 15% decrease. This translates into the death of only one out of every 115 live births (1995), instead of one out of every 84 (1985).

For the first time in four years of presenting these data the teen violent death rate has not increased. In the last three factbooks the teen violent death rate had shown increases of thirteen to forty-two percent. This year's analysis revealed the rate has shown no growth, remaining constant at 67 deaths per 100,000 teens ages 15-19. There is also good news to report about the death rate of children ages 1-14. There has been a 10% decrease in this rate from 30.3 (1988-91) to 27.4 (1992-95) per 100,000 children 1-14.

Also worth noting is that once again there have been positive gains on all three education indicators. Most notable among them is the 23% increase (over baseline) in the third grade reading indicator which has grown from 28.6% in 1992 to 35.3% in 1996.

### Disturbing News

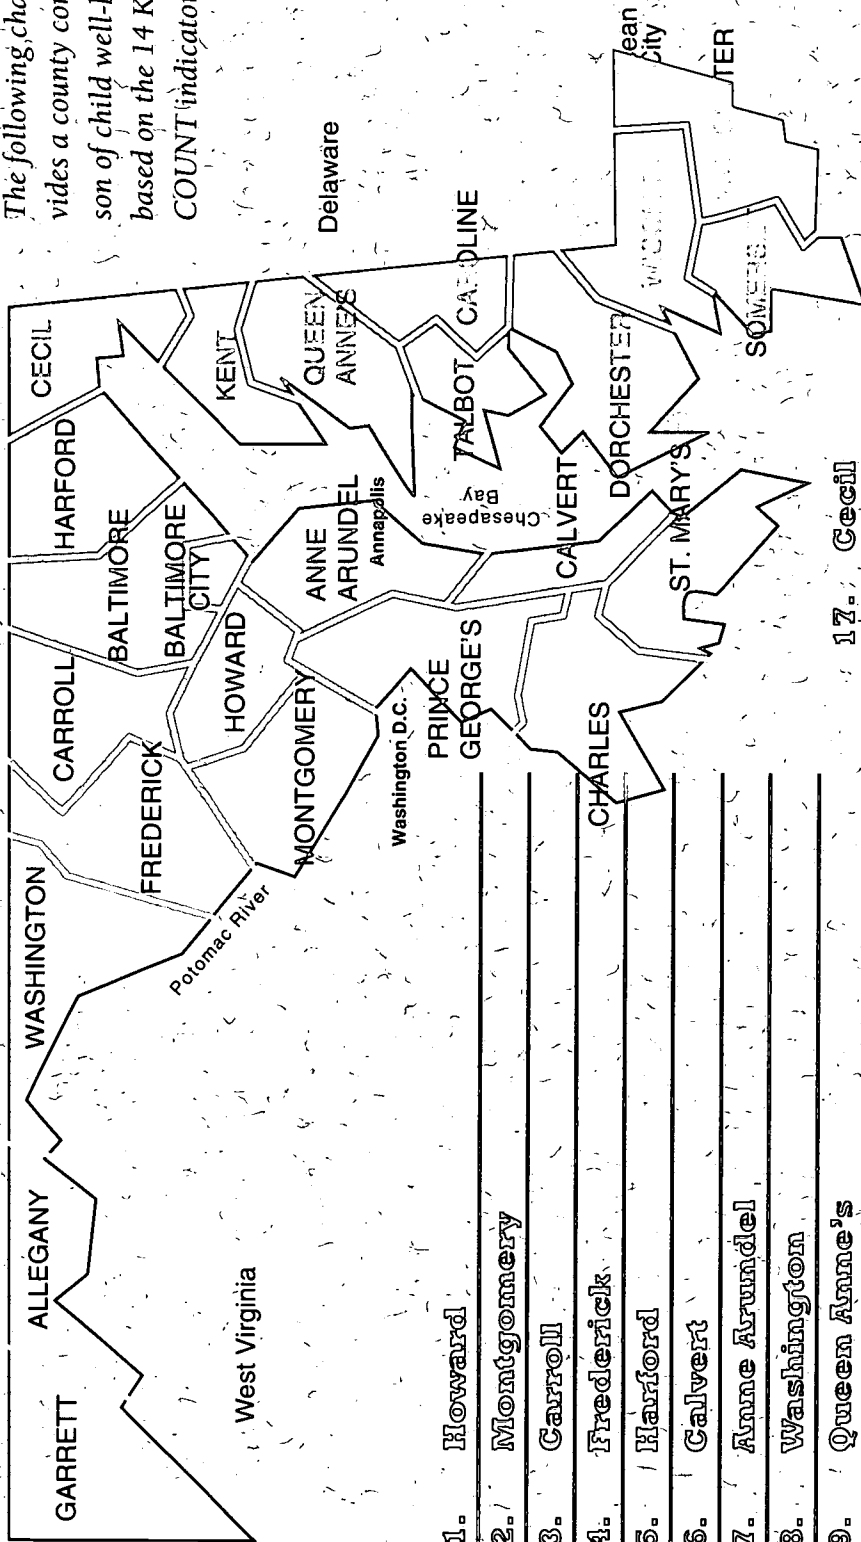

Paramount among the bad news is that 15.1% of our children live below the poverty threshold.

This poverty rate increase of more than one third in six years means that one out of every seven children in Maryland is living without adequate shelter, clothing, nutrition and health care. Additionally, for the fourth year in a row, our analysis has revealed increases in both the percentage of babies born low birth weight and the juvenile violent crime arrest rate.

Just as disheartening as these increases is the continued disparity between African Americans and whites on several key indicators. African American babies are born low birth weight and die before their first birthday at more than twice the rate of white babies. In 1995 one out of every six African American babies was born to a teenaged mother, as compared to one out of every fifteen white babies. The teen violent death rate for African American teenagers is 150% higher than for white teens. On nearly every indicator where it is possible to analyze by race, African American children are faring far worse than are white children.

# How Maryland Counties Rank

Pennsylvania

The following chart provides a county comparison of child well-being based on the 14 KIDS COUNT indicators.

1. Howard	17. Cecil
2. Montgomery	18. Worcester
3. Carroll	19. Prince George's
4. Frederick	20. Caroline
5. Harford	21. Wicomico

## Guide to the Factbook

**T**he 1996 Factbook provides data for 14 indicators of child well-being for each county. County-specific data are reported for time periods marked THEN and NOW. Data presented under the category of NOW are the most current data available. Because of time required for the collection and assembly of data by the agencies that serve as our primary data sources and the time required to produce the Factbook, data from 1995 and in a few instances 1996 are the most current available. Please note that "year" may be calendar year or fiscal year. Please refer to the methodology section for clarification. Data presented under the category of THEN serve as baseline years. The reader is cautioned to check each indicator to determine the exact time period being reported. The data in the 1996 Maryland KIDS COUNT Factbook is presented in three different ways: number, rate, and rank.

**NUMBER:** The most direct measure of the scope of a problem is the count of the number of events of concern, for example the number of births to mothers under age 20. County factsheets show the number of events for a designated time period.

**RATE:** A rate measures both the likelihood of an event and the severity of a problem. For example, if 10 out of every 100 births are low birthweight that is a low birthweight rate of 10 per 100 births or 10%. A rate is useful if you want to compare the severity of the problem in one area to another or from one time period to another. However, if you are planning an intervention and estimating the required resources, you will need to know the actual numbers.

A rate is calculated by dividing the number of events of interest by the number of persons that are "eligible" for the event and multiplying the yielded value by the chosen multiplier (e.g. 100, 1,000, 10,000, etc.)

**RANK:** In the 1996 Factbook, we used the rate or percentage to assign a ranking for each of the fourteen indicators. These rankings are then used to calculate overall county rankings. The overall ranking of a county is based on the sum of its rankings for each indicator. The county with the lowest sum total has the highest (best) rank. The county with the highest sum total has the lowest (worst) rank. The county rank tells how well the children in each county are faring compared to other jurisdictions in Maryland.

High School Program Completion

Families should be able to feed, clothe and house their children.

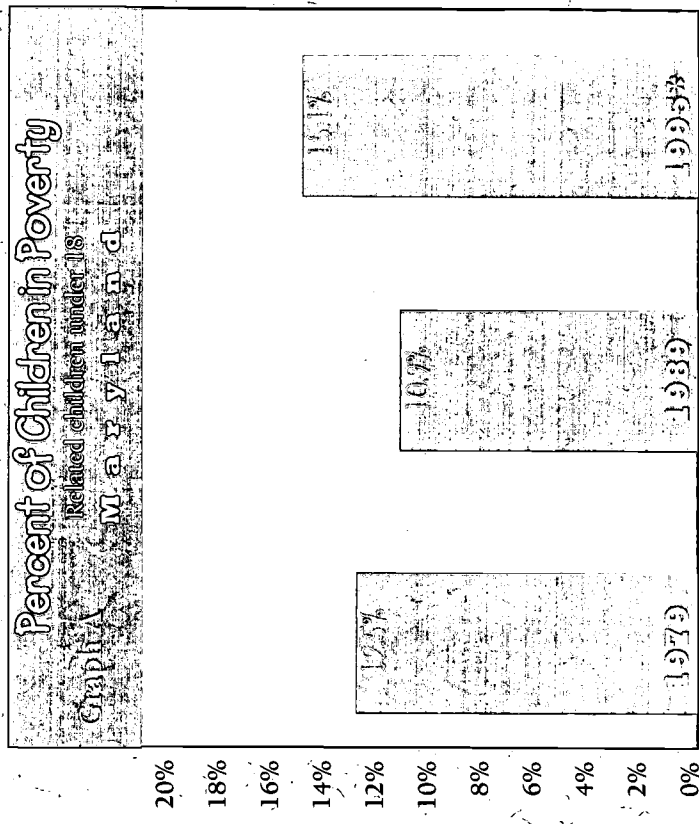

## Overview

### ECONOMIC WELL-BEING

#### Child Poverty

**Indicator Definition:** Child poverty is the percent and number of related children under 18 whose families have incomes below the U.S. Poverty Threshold. The base year data presented at the state and county levels are from the 1990 and 1980 census respectively. The process of estimating poverty during intercensal years is complicated and estimates are prone to high standard errors. Use of the Current Population Survey (CPS), a yearly survey done of 50,000 American homes, has proven to produce acceptable estimates of poverty rates at the state level which can be used with caution. Research has indicated that an acceptable poverty rate estimate may be obtained by averaging 3 to 5 years of CPS poverty rate estimates. For this reason the state poverty rate presented in the 1996 Factbook is a mean (average) of CPS poverty rate estimates for years 1991-1995. Because of the relatively small sample size of the CPS, county level poverty rate estimates are not possible, therefore most current year data at the county level are from the 1990 census.

**Significance:** Economic security is the necessary first step to giving a child the opportunity to fully realize his or her potential. Because poverty affects virtually every area of a child's life, it is one of the most widely used and powerful indicators of child well-being. Children living in poverty are more likely to suffer from a host of problems including lead poisoning, abuse and neglect, problems in school, premature parenthood and developmental delays associated with pre and post-natal malnutrition. While poverty is a problem for all of Maryland's children, children of color are disproportionately poor. African American children are nearly four times more likely to live in poverty than

YEAR

\* Percentage is a mean of Current Population Survey estimates, 1991-95.  
Source: US Bureau of the Census.

white children. It is projected that by the year 2010 half of all African American and Hispanic children will be poor.

**MARYLAND FINDINGS:** Between 1979 and 1989 there was a 13% drop in the number of children living in poverty in Maryland. Unfortunately this downward trend has not held. Based on Current Population Survey poverty rate estimates, the percent of children living in poverty has increased from 10.9% in 1989 to 15.1% in 1995. This means that there are close to 50,000 more children living in poverty today than in 1989.

**COUNTY FINDINGS:** Although the 1990 census reports that 20 Maryland counties saw a reduction in the percentage of its' children living in poverty between the years 1979 and 1989, children are still the poorest of Maryland's citizens. Baltimore City and Allegany County have the highest percent of children

## Overview

### How Poverty is Measured:

The federal government's official poverty index is used to classify people as above or below the poverty line. The poverty level, created in 1964, was computed by using as a yardstick the amount of money necessary to purchase the lowest nutritionally adequate diet. This price was then multiplied by

three to obtain a poverty threshold. A family is officially classified as poor if its cash income (wages, pensions, social security benefits and all other forms of cash income) falls below the poverty threshold. The poverty income thresholds are updated each year to reflect changes in the Consumer Price Index (inflation). The 1996 poverty guideline is \$12,273 for a family of three.

living in poverty, 32.2% and 24% respectively. Of the four counties with an increase in the percent of its children living in poverty, Allegany County had the largest increase from 15.4% in 1979 to 24% in 1989, a 56% increase. Calvert and Charles Counties had impressive decreases on this indicator of between five and six percentage points each, dropping to 6.5% and 5.4% respectively.

### Child Support

**Indicator Definition:** This indicator is the number and percent of child support cases with active court orders for which any payment has been received. A serious limitation of this data is that a payment can be as little as \$1 and still be considered a payment.

**Significance:** With the rates of out-of-wedlock births and

divorce on the rise, more than one-half of the children in Maryland will spend some or all of their childhood in a single parent home. All too often a one parent family means one income and trans-

lates into more children in poverty. In Maryland one in five children living in a single parent family is living in poverty. Even more dismal, 40% of children under five living in female-headed households are living in poverty. The lack of child support by non-custodial parents threatens the economic, physical and emotional well-being of many of our children.

**MARYLAND FINDINGS:** While the percent of paying cases has risen slightly from 34.1% in 1993 to 35% in 1996, this is actually a decrease from 1995 when 35.6% of cases with court orders were paying cases. The importance of these fluctuations are negligible. The bottom line is between the years 1993 and 1996 approximately 65% of court ordered child support cases received no payment.

## Overview

**COUNTY FINDINGS:** In 1996 nearly every county demonstrated an increase on this indicator ranging from very slight increases of one percentage point (Cecil County) to more significant increases of twelve percentage points (Talbot). The two jurisdictions with the most cases are Prince George's County and Baltimore City. While Baltimore City's percent of paying cases for 1996 has essentially remained unchanged since 1993, Prince George's County's percent of paying cases fell by six percentage points. However, despite this decline Prince George's County is still significantly more successful in collecting payments with more than 52% of its cases paying compared with only 16% of Baltimore City's.

### Teen Birth

**Indicator Definition:** This indicator is the percent of all births at the state or county level to women under age 20. Because this indicator is a percentage of all births rather than a population-based rate it should be used with caution, especially in instances where the numbers are small. Fluctuations in the number of births in a jurisdiction can have significant and misleading effects on percentages. For example, if in 1993 one hundred babies were born, forty of them to women under twenty, the percent of births to teens was 40%. However, if the following year only 80 babies are born but once again 40 are born to teenaged mothers, the percent births to teens is now 50%. At face value one might incorrectly surmise that more teenagers had babies in 1994 than in the previous year. For this reason the population-based teen birth rate must also be considered in order to accurately pinpoint the nature of the trend. A population based rate is the measure of the likelihood of an event. In this case it is the likelihood that out of every

Graphic: Maryland 1995-96  
Percent Births to Teens (15-19)

YEAR

Source: Maryland Department of Health and Mental Hygiene  
\* African American may include other races

1,000 females ages 15-19 "x" will give birth. A rate is calculated by dividing the number of events by the number of people eligible for the event.

**Significance:** Babies born to teenaged mothers are more likely to suffer a host of lifelong problems. Pregnant teens are more likely to have inadequate or no prenatal care, suffer preterm labor, and the babies born to them have a higher incidence of being low birth weight and dying before their first birthday. There are considerable economic hurdles to overcome as well. In 1994 nearly 90% of Maryland women under 20 who gave birth were unmarried. While there is heated debate about what these statistics say about American morality, there can be no argument that they foretell a generation of

## Overview

children who will live in poverty because they live in a one income, female-headed family. Many of these young women have little education and even less earning potential. Teenage parents are two times more likely to live in poverty and earn fully one half as much as women who begin childbearing after age twenty. This translates into mothers who are unable to provide an adequate living environment, suitable nutrition and quality health care for their children.

**MARYLAND FINDINGS:** Since 1985 there has been a gradual decrease in the percent of total births to teens from 12.1% to 10.2% in 1995. As graph C illustrates, this decline holds consistent when the races are separated; for African Americans and whites the percent of births to teens has dropped between two and three percentage points in the past ten years. While the percent of total births to teens has decreased since 1985, the teen birth rate has grown by 18% from 41.2 per 1,000 in 1985 to 48.4 in 1994. An examination of graph D illustrates what appears to be a dramatic jump in teen birth rate between 1988 and 1989. Because the population estimates used to calculate teen birth rate between census years 1979 and 1989 had overestimated the teenage population, the resulting rates were too low. The reason for the steep magnitude of the increase in 1989 is because 1989 was a census year and the rates were based on actual census numbers rather than on flawed population estimates. Since 1991 the teen birth rate has decreased by 12% but is still 16% higher than in 1985.

**COUNTY FINDINGS:** The analysis for the 1996 Factbook yielded decreases in the percent of births to teens in nineteen of the twenty-four counties in Maryland. During the past ten years the counties in the Baltimore metropolitan area, the Eastern Shore area, and both the Southern and Northwest areas have shown reductions in the percent of total births to teenaged

Graph D  
Teen Birth Rates  
Maryland  
1985-94

**YEAR** Source: Maryland Department of Health and Mental Hygiene  
+ Census year \* African American may include other races

mothers, dropping an average of two percentage points. This is especially good news for the Baltimore metro area which experienced a 15.7% decrease in the number of babies born to females under 20 between the years 1985 and 1995. Teen birth rate has followed the same pattern at the county level as at the state level, overall rising slightly over the last ten years. Counties in the Baltimore metropolitan and Eastern Shore areas have the highest teen birth rates in the state.

### GOOD HEALTH

#### Low Birthweight

**Indicator Definition:** The rate of low birthweight births is the number and percent of babies born weighing 2500 grams (5.5 pounds) or less at birth.

**Significance:** The strength of this indicator is that it is an estimation of both the child's immediate and future health and well-being. It is also the strongest indicator of infant survival. Babies who are born low birthweight are at greater risk for dying during their first year of life, more likely to have neurodevelopmental problems (e.g., cerebral palsy), mental retardation and learning disabilities, birth defects and face a greater probability of being abused or neglected. Additionally, the rate of babies born low birthweight is a reflection of maternal health and general well-being. Mothers who give birth to babies of low birthweight are often economically disadvantaged, poorly educated, undernourished and have limited access to health care. They are also more likely to have used drugs, alcohol and tobacco during pregnancy. All of these factors are well documented risk factors for giving birth to a low birthweight baby. While the majority of low birthweight babies develop normally, most children with developmental disabilities were born low birth weight. There is great disparity in low birthweight rates between African Americans and whites. Nationally, African Americans are more than twice as likely to have a baby weighing under 2500 grams than are whites. While it is clear that some of this disparity is due to African Americans being disproportionately poor and therefore exposed to many of the well-documented risk factors for low birthweight, it does not account for all of it. Hispanics who are

Children should have the physical and mental health care they need to be healthy, secure and strong.

Graph E  
Low Birth Weight Babies  
Maryland 1985-1995

also disproportionately poor have rates of low birthweight and infant mortality similar to whites.

**MARYLAND FINDINGS:** The analysis of the low birthweight rate for years 1985-1990 as compared to years 1991-1995 finds a slight increase in the rate from 7.9% to 8.3%. As the graph illustrates, between 1985 and 1995 African American babies are born low birthweight at a consistently higher rate than their white counterparts. In 1995 the low birthweight rate for African Americans was more than twice the rate for whites.

**COUNTY FINDINGS:** For the third year Carroll County is ranked first on this indicator, having the lowest low birthweight rate in the state. While the increases are not dramatic, sixteen counties did have increases of two percentage points or less.

## Overview

### Infant Mortality

**Indicator Definition:** Infant mortality rate is the number of infants who die before their first birthday per 1,000 live births.

**Significance:** Infant mortality rate is an outcome measure which reflects the overall health of a community. It encompasses the health of women during pregnancy, the general health of infants, the adequacy of pre and post-natal health care and the quality of the living conditions during an infant's first year of life. There are a number of risk factors highly correlated with infant mortality including low birthweight, poverty and birth to a teenaged parent. The major causes of infant death are sudden infant death syndrome (SIDS), birth defects, unsafe housing and inadequate supervision.

Graph F  
Infant Mortality Rates  
Maryland 1985-1995

YEAR Source: Maryland Department of Health and Mental Hygiene  
\* African American may include other races

**MARYLAND FINDINGS:** The infant mortality rate has been steadily declining for the last ten years from 11.9 deaths per 1,000 live births in 1985 to 8.7 in 1995. Although the African American infant mortality rate has dropped significantly between 1985 and 1995 from 17.8 to 13.2, it is still twice the white infant mortality rate, which decreased from 9 per 1,000 to 6 during the same period.

**COUNTY FINDINGS:** Between the years 1985-1990 and 1991-1995 infant mortality rates declined for twenty counties. An examination of infant mortality rates over the last ten years illustrates a notable decline for the vast majority of Maryland counties. Most notable among these decreases is the Baltimore City rate which decreased from an alarming 16.9 to a lower although still quite troubling 12.5.

### Lead Screening

**Indicator Definition:** Lead poisoning is the percentage and number of children under age six who are screened for lead poisoning by venous or capillary (fingerstick) specimen. Children with blood lead levels of 10-19 mcg/dL (venous) or 10 mcg/dL or more (capillary) are diagnosed as lead exposed. A diagnosis of lead poisoning is made with venous blood lead levels of 20 mcg/dL or higher. Laboratories are required to report the results of all lead screens to the Maryland Childhood Lead Registry Program. However, due to less than 100% compliance with this requirement and incomplete reporting of some of the results, thousands of children are screened whose results are excluded due to incomplete or absentee reporting.

**Significance:** The dangers of sustained lead exposure are well documented. Young children under six who have prolonged lead exposure are at risk for neurological complications including

## Overview

Children should have caring families, safe homes, schools and streets that are free of

fear and violence. Children at greatest risk are poor, and live in sub-standard or older housing. An estimated ninety-five percent of homes built in Maryland before 1950 contain lead paint. Seventy-five percent of homes built as recently as 1978 are believed to contain lead. In 1991 Maryland adopted the Centers for Disease Controls recommendation for universal screening of all children under six. An anticipated revision of this recommendation is expected in 1997 which will advise each state to devise their own guidelines based upon the prevalence of lead poisoning and presence of risk factors. The Maryland State Department of the Environment is expected to change their recommendation to universal testing of only high risk children, although they anticipate continuing the universal screening recommendation for Baltimore City.

**MARYLAND FINDINGS:** The good news is that 40% more Maryland children were screened for lead exposure in 1995 than in 1992. However, even though over 70,000 children were screened for lead this represents only 16% of the population, far from the goal of universal screening. Also disturbing is that of those children screened, the percentage with lead exposure or poisoning has risen from 9% in 1992 to over 17% in 1995.

**COUNTY FINDINGS:** There were increases in the number and percent of children screened for lead exposure between 1992 and 1995 in twelve counties including Baltimore City which had a more than 50% increase in the number of children screened. Unfortunately during this same time period twelve counties saw decreases, some quite serious, (e.g., Baltimore County dropped to a paltry 2.1% from 13.5%). The percentage of children screened ranges from a high of 57.1% (Baltimore City) to a low of 2.1% (Baltimore County).

## SAFETY

### Child Abuse and Neglect

**Indicator Definition:** The rate of indicated child abuse investigations is a proxy indicator for the occurrence of child abuse and neglect in our community. It is a rate based on the number of indicated child abuse investigations in each county and the state as a whole. Each year in Maryland there are approximately 29,000 child abuse/neglect investigations and each one is given a final disposition of either unsubstantiated, indicated or ruled out. An indicated finding means "there is credible evidence which has not been satisfactorily refuted, that abuse, neglect, or sexual abuse did occur." This data must be interpreted with cau-

## Overview

tion, as it is not the true occurrence of child abuse or neglect in our community. It is only an estimation of the magnitude of the problem. It has been estimated that only five percent of incidences of child abuse are ever reported. Another cause for caution are changing regulations within the child welfare system which may affect how many cases are investigated and how they are dispositioned. If a county is forced to decrease the number of investigators on staff due to funding constraints, the result may be fewer investigated cases and therefore, fewer indicated investigations. The result would be a downward trend, not because fewer children were being harmed but because of artificial influences. These influences need to be taken into account when interpreting these data.

**Significance:** Child maltreatment is a serious community problem which reflects society's failure to care for, nurture, and

protect children. Maltreatment has devastating lifelong effects on its victims. We now know it is not just the problem of the poor or uneducated. Victims and perpetrators of child abuse come from all classes, races and walks of life. Parents are at greater risk for abusing their children if they are poor, unemployed, have drug and/or alcohol problems, or if they are themselves victims of domestic violence. Child abuse and neglect has serious consequences on a child's physical, behavioral, and cognitive development. Learning disorders, attention problems, low self-esteem, long-term health and mental health problems and even violent behavior can result from childhood maltreatment.

**MARYLAND FINDINGS:** Since 1990 the rate of indicated child abuse investigations has decreased by 12% from 8.2 per 1,000 children under eighteen in 1990 to 7.2 in 1996.

**COUNTY FINDINGS:** Similar to the state level data there have been decreases in the rate of indicated child abuse investigations for fifteen counties including a 47% decrease in Carroll County and a 45% decrease in Harford County. Most notable among the counties with increases is Kent County which demonstrated a remarkable 72% increase from a rate of 3.9 in 1990 to 6.8 in 1996.

## Child Death

**Indicator Definition:** The child death rate is a population-based rate of the number of deaths resulting from all causes per 100,000 children between the ages of one and fourteen. A limitation of this indicator (and of all death indicators) is that it does not shed any light on the quality of life of the numerous children who survive life-threatening injury or illness.

# Overview

**Significance:** Child death rate is an outcome measure which provides information about the health status of children in our state and the risk factors to which they are exposed. Child deaths are outcomes of either health problems (e.g., birth-related problems, childhood illness, or untreated chronic conditions), or injury (e.g., unsafe living environments, intentional/unintentional accidents). It is also a measure of the effectiveness of public health and accident prevention/public education strategies, i.e. use of smoke detectors, safety belts/car seats, and bike helmets. Children who live in poverty are 2-3 times more likely to die as a result of injury, and 3-4 times more likely to die from illness than children who are not poor. It is hypothesized this disparity is due

to limited access to quality emergency and non-emergency healthcare and because poor children often live in unsafe environments where they are exposed to violence, environmental hazards and inadequate supervision.

**MARYLAND FINDINGS:** Our aggregate year analysis yielded a 10% decrease in the child death rate from 30.3 per 100,000 during years 1989-1991 to 27.4 during years 1992-95. Between the years 1990 to 1995, the child death rate for whites also decreased by 10% to 21.4 per 100,000 from 23.7. For African Americans and other races the rate has remained unchanged at 34.4 per 100,000, fully 60% higher than the rate for white children.

**COUNTY FINDINGS:** There have been significant reductions on this indicator in sixteen counties. The Eastern Shore counties experienced the most dramatic decreases, including a 65% decrease in Queen Anne's County from 50.7 per 100,000 to 17.5 and a 50% decrease in Talbot County from 45.4 to 22.6. All of the counties in the Baltimore metropolitan area had increases in their child death rate with the exception of Carroll and Baltimore Counties where there were moderate decreases of less than 15%. Of the Baltimore area counties with increases, the greatest was in Harford County where the rate increased by 40%.

## Overview

### Teen Violent Death

**Indicator Definition:** Teen violent death rate is the number of teenagers 15-19 who die from homicide, accidents or suicide per 100,000 youths 15-19.

**Indicator Significance:** Like the child death rate, the teen violent death rate is an outcome measure which gauges behaviors by teens which have resulted in death. A significant component of this indicator is that it is not only a measure of environmental risks but also of the risk-taking behavior of teens. The developmental stage which peaks during adolescence has a well-documented risk taking component which may lead teenagers into dangerous and even life-threatening situations. Teen violent death is also an indicator of the stress, hostility and/or despair teens may feel and the degree to which they have adequate social and family support and access to mental health and other services.

**MARYLAND FINDINGS:** An aggregate year analysis of teen violent death for years 1988-91 and 1992-95 has shown little change in the state level teen violent death rate. However, as the accompanying graph illustrates, there are significant and enduring gender and race based rate differences. Clearly African American adolescent males are dying at the hands of violence significantly more than any other group. The rate for this group is consistently two to eight times higher than for any other. In 1995 the teen violent death rate for African American males was 200% higher than for white males; 500% higher than for African American females; and 700% higher than for white females.

**COUNTY FINDINGS:** The 1996 analysis yielded decreased teen violent death rates in sixteen counties. Caroline county demonstrated the largest decline, reducing by 77% from a rate

\*African American may include other races

of 120 per 100,000 during years 1988-91 to 27.6 per 100,000 during years 1992-95. During the same time period five other counties had decreases in their rates of 40% or greater.

### School Violence

**Indicator Definition:** Violence related suspension rate is the number of suspensions or expulsions resulting from verbal or physical attacks against teachers, staff or students per 1,000 students. Although guidelines exist, there is no uniform statewide code for determining whether an act warrants suspension or expulsion, so the decision to expel or suspend is up to the discretion of each school administrator. The result is that behavior that warrants expulsion in one school may not warrant it in another, making comparisons of rates problematic. The reader should use caution in interpreting these data.

## Overview

**Significance:** The number of violence related school suspensions/expulsions is one of the few ways to assess the level of violence in schools and gives us a window into the environment in which children spend a great deal of time. The school environment is not impervious to the rising problems in the community. When the level of violence increases in our neighborhoods, it is reflected in schools and negatively affects this critically important environment in which children need to feel safe in order to learn and grow. Violence within school walls hinders the social development of students and impedes the learning process. It causes increased stress for students, teachers and staff and creates an atmosphere of fear which ultimately interferes with teaching and learning. According to a November, 1994 survey of 700 communities by the National League of Cities, one in every four schools reported serious injury or death due to violence in the previous year.

**MARYLAND FINDINGS:** Since school year 1992-93 the violence related suspension rate fluctuated between 35 and 40 violence related suspensions per 1,000 students. There was an 10.3% increase between school year 1994-95 and 1995-96 from 34.7 to 38.3.

**COUNTY FINDINGS:** There were increases in the violent suspension rate in eighteen counties between school years 1992-93 and 1995-96. Somerset County is ranked lowest on this indicator. Although there has been a 34% decrease in their rate since 1993, it is still the highest in Maryland with a rate of 120.2 per 1,000 students. It is worth noting that there has been a remarkable decrease in the rate for Baltimore City schools. The violent suspension rate has fallen from 56.3 in 1993 to 23.5 in 1996, a more than 58% decrease in four years.

## Overview

### Juvenile Violent Crime Arrest Rate

**Indicator Definition:** The juvenile violent crime arrest rate is the number of arrests of juveniles for a violent offense (i.e. homicide, aggravated assault, forcible rape, and robbery), per 10,000 youths ages 10-17.

**Significance:** Being arrested for a violent crime clearly has serious short and long term ramifications and can significantly affect the life course of affected adolescents. There are a number of factors which place adolescents at risk for becoming involved in violent crime. Living in unstable communities with high poverty rates, elevated school dropout rates, teen pregnancy and unemployment rates are all risk factors which place adolescents at jeopardy for committing a violent crime. Children who have been neglected, abused and/or exposed to family violence are also at risk for displaying aggressive and violent behavior.

**MARYLAND FINDINGS:** The teen violent arrest rate for Maryland decreased by 10% between 1994 and 1995. However when looking back to 1990 we find an overall increase of 6% growing from 57.8 per 10,000 youths 10-17, to 61.4 in 1995. The actual number of violence related juvenile arrests has grown by more than twenty percent in the last five years.

**COUNTY FINDINGS:** At the county level there have been tremendous increases in the rate of teen violent arrests. Between the years 1990 and 1995 sixteen counties experienced elevations in their rates, many of them tremendous in magnitude. Howard County's rate has increased from 12.4 in 1990 to 44 in 1995, a jump of more than 250%. Other jurisdictions whose rates increased more than twofold include Anne Arundel, Caroline, Kent, Talbot, and Baltimore counties.

## Overview

### PREPARING FOR ADULTHOOD

#### THIRD GRADE READING

**Indicator Definition:** Third grade reading is the percent of students scoring satisfactory on tests given as part of the Maryland School Performance Assessment Program.

**Significance:** The Maryland School Performance Assessment Program (MSPAP) was begun in 1993 to assess school performance as a part of the education reform movement in Maryland. Results for individual students are combined to assess the overall performance of a school, and ultimately of the entire school system at the county and state levels. All students in grades 3, 5 & 8 participate, (few are exempted) in assessments on reading, mathematics, language usage, science and social studies. MSPAP focuses on "higher level thinking and skills" i.e., it assesses students' ability to apply knowledge and skills to solve real-life problems and make decisions. Third grade reading ability is a powerful indicator of future academic achievement and is closely associated with household income. The 1993 Maryland School Performance Report showed that as poverty increased, student reading levels decreased. Students attending schools with less than 5% of students receiving free or reduced lunch (a proxy indicator of poverty) are four times more likely to score satisfactory or better in third grade reading than students in schools with seventy to one hundred percent of students receiving free or reduced lunch. Other factors highly correlated with poor student performance are low birth weight, inadequate nutrition, lead poisoning and child abuse/neglect.

Children should learn how to become responsible adults who can advance themselves while being sensitive to others.

## Third Grade Reading Scores Maryland 1992-1996

Graph M  
Maryland Standard

SOURCE: MARYLAND SCHOOL PERFORMANCE ASSESSMENT PROGRAM

**MARYLAND FINDINGS:** While still far below the Maryland satisfactory standard which requires at least 70% of students to score satisfactory or better, there has been steady improvement in the last four years. In school year 1992-93, 28.6% of students reached this goal. In school year 1995-96 it increased to 35.3%, a more than twenty-three percent increase.

**COUNTY FINDINGS:** All jurisdictions except Baltimore City and Somerset, Garrett and Queen Anne's counties, had a higher percentage of students scoring satisfactory on MSPAP in 1995-96 than when the assessment program began in 1992-93. Most notable among these increases is Dorchester County where there have been significant gains each year resulting in an increase from 15.2% in 1992-93 to 40.4% in 1995-96. Baltimore City ranked last on this indicator for the fourth year in a row, with more than twelve percentage points between it and the next lowest-ranked county.

## Overview

### ON-TIME GRADUATION

**Indicator Definition:** On-time graduation is the percentage of students who complete their high school education within four years. This is calculated by the number of June graduates divided by the number of students enrolled in ninth grade four years earlier. This rate does not include those who drop out of high school and eventually earn their high school diploma or General Equivalency Diploma (GED) and does not take into account entrants and withdrawals during the four year period.

#### On-Time Graduation

Maryland 1990-1996

Source: Maryland State Department of Education

**Significance:** While earning a high school diploma does not guarantee economic security it does indicate a student's acquisition of basic knowledge and skills upon which he or she may build, either in continued formal education or in the workplace. A teen who does not complete at least this much formal education faces a restricted range of employment opportunities and severely limited earning potential. Competition for these low wage, unskilled jobs will be increasing with the influx of former welfare recipients that are anticipated due to welfare reform. Individuals who do not complete high school are more likely to live in low-income families, have a handicapping condition or a learning disability, have repeated at least one grade, engage in delinquent behavior and have a child before the age of 20.

**MARYLAND FINDINGS:** Since 1990 the percent of on-time graduates has remained relatively stable at approximately seventy-five percent.

**COUNTY FINDINGS:** At the county level there has been little remarkable change on this indicator, in either direction. While twelve of the twenty-four counties showed improvement they were minimal. Only Fredrick County has increased by nine percent from 87.3% in 1990 to 95.5% in 1996. Somerset County experienced a fourteen percent decrease from 73.3% to 63%.

## Overview

### High School Program Completion

**Indicator Definition:** High school program completion is the percent of graduating students who have completed the minimum requirements for admission into the University of Maryland System in addition to completion of requirements to receive a high school diploma.

**Significance:** In this age of rapidly evolving technology, education beyond high school is necessary to be competitive and marketable in the job market. Today's most lucrative and briskly expanding careers require greater technical knowledge, advanced language skills and the ability to apply complex theories and concepts. The economic benefits of a college education are clear; education and income are positively correlated. As educational attainment increases income also

increases. However, despite the obvious benefits to completing an advanced degree, nationally less than half of high school graduates go to college and of those who go, only about twenty-five percent complete their degree. There are also racial and gender differences in educational attainment. In 1990 12% of white males and 10% of white females in Maryland reported having a bachelor's degree as compared to 5% of African American males and 6% of African American females.

**MARYLAND FINDINGS:** Since 1991 the percent of students graduating having completed the minimum requirements for admission to the University of Maryland System has increased steadily to over 50%. This is an increase of more than sixteen percent in five years.

**COUNTY FINDINGS:** Fifteen counties have experienced increases on this indicator since 1991, many of them significant. The most notable is a 151% increase in Harford County from 24.4% in 1991 to 61.4% in 1996. In 1991 there were only two counties where at least half of graduates had completed the minimum requirement for entrance into the University of Maryland System. In 1996 there were eight counties who reached this target.

## Family Economics (1990)

	Number	Percent
Median Family Income (1989)	\$33,089	
Average Income of Married-Couple (1989)	\$46,465	
Average Income of Female-Headed Family (1989)	\$14,687	
% Median Income Spent on Child Care (1996) (based on family of 4 - a couple & 2 children ages 1-2 & 3-5)		20.6%
Weekly Cost of Family Day Care (child 0-2) (1996)	\$70.98	
% of Idle Teens (ages 16-19)** (1989)		6.7%
** Teens who are not in school, not working and not looking for work		

# Appendix

# Appendix

The following tables present data by county on the fourteen KIDS COUNT indicators. These are the same data that are represented on the individual county factsheets but are in aggregate form allowing the reader to more easily compare actual numbers and rates, and appreciate the range between the highest and lowest ranked counties on each indicator. There are two additional tables of data that are not included on the county fact sheets, they are teen birth rate, and lead poisoning. These extra data elements will aid the reader in interpreting related KIDS COUNT indicators.

## Child Poverty

Number and percent of children (under age 18)  
living below the federal poverty level

# Methodology and Sources

## Methodology and Sources

The information in the Maryland KIDS COUNT Factbook comes from both state and national sources. Data were collected from state departments and agencies and United States government bureaus. This section identifies both the primary and secondary data sources and the methodology used to compute findings.

### ECONOMIC WELL-BEING

#### Child Poverty

Child poverty is the number and percent of related children under 18 living in families with incomes below the U.S. Poverty Threshold as defined by the U.S. Bureau of the Census. "Related children" include family head's children by birth, marriage, or adoption under age 18, as well as other persons under 18 who are related to the family head. The data were obtained from the Maryland Office of Planning Analysis of the U.S. Bureau of the Census, Census of Population and Housing 1990, STF-3A, tables 123, 124, 125, and 126 and Bureau of the Census, 1980 Census of

Population, STF-3A. State level data were derived from unpublished March 1991-1995 Current Population Survey data supplied by the U.S. Bureau of the Census.

Racial Differences in Child Poverty in the U.S., A Linear Trend Analysis to the Year 2010, (1993). Center on Hunger, Poverty and Nutrition Policy, Tufts University.

#### Child Support

Child support is the number and percent of court-ordered child support cases in which any payment is received. These data are generated by computing a 12 month fiscal year average and were supplied by the Maryland Department of Human Resources.

1996 Fact Pack, Maryland Department of Human Resources.

Nazario, Thomas A., (1988). In Defense of Children: Understanding the Rights, Needs, and Interests of the Child. A Resource Book for Parents and Professionals, Charles Scribner's Sons: New York.

#### Births to Teens

Births to teens is the percentage of total births born to women under the age of 20. The percent is computed by dividing the number of babies born to women under age 20, by the total number of babies born. That number is then multiplied by 100. Birth data were obtained from the Maryland Department of Health and Mental Hygiene, Division of Vital Statistics. Teen birth rates (rate per 1,000) were calculated and provided by the Maryland Department of Health and Mental Hygiene, Division of Vital Statistics.

# Methodology and Sources

## GOOD HEALTH

### Low Birthweight

Low birthweight is the percentage of all births of infants weighing less than 2500 grams (5.5 lbs.) at birth. The data were provided by the Maryland Department of Health and Mental Hygiene, Division of Health Statistics.

### References:

Gells, R.J., (1992). Poverty and Violence Toward Children. American Behavioral Scientist, 35(3):258-274.

Understanding Child Abuse and Neglect, (1993). National Research Council.

Kramer, J.C. Racial and Ethnic Differences in Birthweight: The Role of Income and Financial Assistance. Demography, May 1995, 32 (2).

### Infant Mortality

The infant mortality rate is the number of deaths of infants under one year of age, per 1,000 live births. The data were provided by the Maryland Department of Health and Mental Hygiene, Division of Health Statistics.

### References:

Miller A., Fine A., & Adams-Taylor S., (1989). Monitoring Children's Health:

Key Indicators, American Public Health Association: Washington, DC.

The Health of America's Children, (1991). Children's Defense Fund: Washington, DC.

### Lead Poisoning

Lead poisoning is the percentage of children under age six screened for lead poisoning. Data were obtained from the Maryland Department of the Environment, Childhood Lead-Registry program.

### References:

Preventing Lead Poisoning in Young Children, (1991). Centers for Disease Control, U.S. Department of Health and Human Services.

Case Studies in Environmental Medicine: Lead Toxicity, (1992). Public Health Service, U.S. Department of Health and Human Services.

## SAFETY

### Child Deaths

Child death rate is the number of deaths from all causes of children 1-14 years, per 100,000 children 1-14. Data were obtained from the Maryland Department of Health and Mental Hygiene, Division of Health Statistics. The total number of children ages 1-14 for the years 1988-95

were based on population estimates from the Maryland Department of Health and Mental Hygiene, Division of Health Statistics.

### References:

Miller, A., Fine, A. & Adams-Taylor, S., (1989). Monitoring Children's Health: Key Indicators. American Public Health Association: Washington DC.

Nazario, T., (1988). In Defense of Children: Understanding the Rights, Needs, and Interests of the Child. A Resource Book for Parents and Professionals, Charles Scribner's Sons: New York.

### Teen Violence Deaths

The teen violent death rate is the number of deaths from homicides, accidents, and suicides of youths ages 15-19, per 100,000 youths ages 15-19. The data were supplied by Maryland Department of Health and Mental Hygiene. The total number of teens ages 15-19 for the years 1988-95 were based on Maryland population estimates from Maryland Department of Health and Mental Hygiene, Division of Health Statistics.

## Methodology and Sources

Losing Generations: Adolescents in High Risk Settings, (1993). Commission on Behavioral and Social Sciences and Education, National Research Council: Washington, DC.

### Child Abuse and Neglect

The child abuse and neglect rate is the number of indicated investigations per 1,000 children ages 0-17. An investigation can involve one or more children. This fiscal year data were provided by the Maryland Department of Human Resources. Data on total population under 18 were based on population estimates from the Maryland Department of Health and Mental Hygiene, Division of Vital Statistics.

### References:

Understanding Child Abuse and Neglect, (1993). National Research Council: Washington D.C.

ment of Health and Human Services, Administration for Children and Families, Administration on Children, Youth and Families, National Center on Child Abuse and Neglect: Washington, DC.

### Juvenile Violent Crime Arrest

Violent crime is defined as homicide, forcible rape, robbery, and aggravated assault. Arrest rates could include repeat arrests of the same individual for different offenses. Juvenile violent crime arrest rate is the number of violent arrests of youth ages 10-17 per 10,000 youths of those same ages. The arrest rate reflects the number of arrests, not the number of adolescents involved in an arrest.

In 1990 and 1995, the number of juvenile violent crime arrests in the counties do not sum the state total due to arrests made by statewide agencies. Juvenile violent crime arrest data were obtained from the Maryland State Police, Uniform Crime Reporting Program. The number of youth, ages 10-17, was obtained from population estimates from the Maryland Department of Health and Mental Hygiene, Division of Vital Statistics.

Department of Health and Mental Hygiene, Division of Vital Statistics.

Walsch, Lorraine B., (1993). Helping Children Cope with Violence. Young Children, May 1993.

### School Violence

School violence is the number of physical attacks against teacher/staff, physical attacks against student(s), verbal/physical threats against teacher/staff, and verbal/physical threats against student(s) resulting in a suspension and/or expulsion from school. Data were obtained from the Maryland State Department of Education.

## Methodology and Sources

### PREPARING FOR ADULTHOOD

#### Third Grade Reading

Third grade reading is the number of students who score satisfactorily on the Maryland State School Performance Assessment Program test. Data were obtained from the Maryland State Department of Education.

#### References:

Living in Poverty: Must Students Pay the Price? Maryland KIDS COUNT Partnership: Baltimore.

MSPAP: Maryland School Performance Assessment Program: A Guide for Parents. Maryland State Department of Education, School and Community Outreach.

Improving Learning For All Children:

Education Reform in Maryland 1977-1996. Maryland State Department of Education.

#### On-Time Graduation

On-time graduation is the percentage of ninth grade public school students who complete high school four years later. The rate was calculated by the number of high school graduates divided by the number of ninth grade students enrolled four years prior. The data were obtained from the Maryland State Department of Education.

186

Losing Generations: Adolescents in High Risk Settings, (1993). Commission on Behavioral and Social Sciences and Education, National Research Council: Washington, DC.

Sherman, A. (1994). Wasting America's Future. Children's Defense Fund, Washington, DC.

#### High School Program Completion

High school program completion is the percent of high school graduates who have completed the minimum course requirements that would qualify them for admission to the University of Maryland System. The Maryland State Department of Education provided these data.

#### References:

1996 Fact Pack. Maryland Department of Human Resources.

1996 Maryland School Performance Report. Maryland State Department of Education.

Losing Generations: Adolescents in High Risk Settings, (1993). Commission on Behavioral and Social Sciences and Education, National Research Council: Washington, DC.

### SERVICES/ DEMOGRAPHICS

#### Family Investment Program/Temporary Assistance to Needy Families (FIP/TANF)

FIP/TANF reflects the fiscal year monthly average number of children under age 18 who live in families receiving AFDC benefits. FIP/TANF is a public assistance program that provides cash benefits to poor families with dependent children. It is a block grant funded by both the federal government and the states. States, however, set their own AFDC benefit levels. The data were supplied by Maryland Department of Human Resources.

#### Medicaid

Medicaid notes the fiscal year monthly average number of children under 18 who are enrolled in Medicaid. Medicaid provides medical assistance to low-income elderly, the blind and disabled. It also serves families on AFDC and other low-income women and children. Medicaid is the principal source of health care coverage for poor women and children. Today, every state must provide Medicaid to all pregnant women with children under age six with family incomes less than 133% of the poverty level. Data were

187

## Methodology and Sources

provided by the Maryland Department of Health and Mental Hygiene.

**Women, Infants and Children (WIC) Special Supplemental Nutrition Program**  
Children in the WIC program reflects the monthly average number of children and infants participating in WIC during the fiscal year. They were obtained from the Maryland Department of Health and Mental Hygiene.

### Free and Reduced Price Meals

Students receiving free/reduced price meals is the number of students whose application for free/reduced price meals met income eligibility guidelines of the United States Department of Agriculture. The data were supplied by the Maryland State Department of Education.

### Juvenile Justice Intake

Juvenile Justice is the number and percentage of intake cases in the Department of Juvenile Justice. The Maryland Department of Juvenile Justice provided the data.

### Child Care

Estimated child care costs, food, taxes and housing are based on a two-parent family with 2 children ages 1-2 and 3-5 years. Center based care refers to year round care provided in non-residential facilities for 8-12 hours per day and is licensed by the Child Care Administration of the Maryland Department of Human Resources. Family Day Care pertains to child care provided in the caregiver's home. Caregivers are registered with the Child Care Administration of the Maryland Department of Human Resources and offer full or part time care. Child care data were provided by the Maryland Committee for Children, Inc.

**Estimated Child Population**  
The estimated child population is the number of children in Maryland ages 18 and under. Child population data were derived from the U.S. Bureau of the Census.

### Children's Living Arrangements

Children's living arrangements include the number of children under 18 living with two parents, a single parent and relatives/non-relatives. Data for children's living arrangements were obtained from the Maryland Office of

Planning Analysis of the U.S. Bureau of the Census, Census of Population and Housing 1990, STF-1A.

### Median Family Income

Data were obtained from the Maryland Office of Planning analysis of the U.S. Bureau of the Census, Census Population and Housing 1990, STF-3A, table 109.

### Percent of Children Working

This demographic variable has two components:

- ☐ The percentage of children under age 18 with all parents working (either both parents or the sole parent living with the children)
- ☐ The percentage of women in the labor force with children under 18

All data on working parents were available from the Maryland Office of Planning analysis of the U.S. Bureau of the Census, Census of Population and Housing 1990, STF-3A, tables 73 and 75.

### Teen Unemployment

Idle teen is the number and percentage of youth ages 16-19 not in school, not working and not looking for work. Data were obtained from the U.S. Bureau of the Census, 1990.

# REPRODUCTION RELEASE

(Specific Document)

## I. DOCUMENT IDENTIFICATION:

Title:

Maryland's 1996 Kids Count Factbook

Author(s): Jeanne Everett-Reynolds

Corporate Source:

Publication Date:

7/28/97

## II. REPRODUCTION RELEASE:

In order to disseminate as widely as possible timely and significant materials of interest to the educational community, documents announced in the monthly abstract journal of the ERIC system, *Resources in Education* (RIE), are usually made available to users in microfiche, reproduced paper copy, and electronic/optical media, and sold through the ERIC Document Reproduction Service (EDRS) or other ERIC vendors. Credit is given to the source of each document, and, if reproduction release is granted, one of the following notices is affixed to the document.

If permission is granted to reproduce and disseminate the identified document, please CHECK ONE of the following two options and sign at the bottom of the page.

The sample sticker shown below will be  
affixed to all Level 1 documents

Check here

For Level 1 Release:

Permitting reproduction in  
microfiche (4" x 6" film) or  
other ERIC archival media  
(e.g., electronic or optical)  
and paper copy.

PERMISSION TO REPRODUCE AND  
DISSEMINATE THIS MATERIAL  
HAS BEEN GRANTED BY

\_\_\_\_\_  
Sample  
\_\_\_\_\_

TO THE EDUCATIONAL RESOURCES  
INFORMATION CENTER (ERIC)

Level 1

The sample sticker shown below will be  
affixed to all Level 2 documents

Check here

For Level 2 Release:

Permitting reproduction in  
microfiche (4" x 6" film) or  
other ERIC archival media  
(e.g., electronic or optical),  
but not in paper copy.

PERMISSION TO REPRODUCE AND  
DISSEMINATE THIS  
MATERIAL IN OTHER THAN PAPER  
COPY HAS BEEN GRANTED BY

\_\_\_\_\_  
Sample  
\_\_\_\_\_

TO THE EDUCATIONAL RESOURCES  
INFORMATION CENTER (ERIC)

Level 2

Documents will be processed as indicated provided reproduction quality permits. If permission to reproduce is granted, but neither box is checked, documents will be processed at Level 1.

"I hereby grant to the Educational Resources Information Center (ERIC) nonexclusive permission to reproduce and disseminate this document as indicated above. Reproduction from the ERIC microfiche or electronic/optical media by persons other than ERIC employees and its system contractors requires permission from the copyright holder. Exception is made for non-profit reproduction by libraries and other service agencies to satisfy information needs of educators in response to discrete inquiries."
